SET 2

INSURANCE CLAIMS PORTAL

Agile Product Planning, User Stories, INVEST Review, Acceptance Criteria and Jira Setup

Student Name	N. Harshith
Course / Subject	Agile / Scrum Project Assignment
Project	Insurance Claims Portal
Assignment Set	Set 2

Prepared as a complete assignment response based on the Set 2 task sheet.

Project Overview

The Insurance Claims Portal is a self-service application that allows policyholders to register insurance claims, upload supporting documents, check claim progress and receive settlement notifications. The goal is to make the claims process easier to access, more transparent and less dependent on manual phone or branch follow-ups.

Assumptions: The portal supports authenticated policyholders, common claim categories, secure document uploads and status updates supplied by the insurer's claim-processing team. Actual policy eligibility and settlement decisions remain subject to insurer verification.

Task 1 – Product Vision and Waterfall-versus-Agile Comparison

Product vision statement

For policyholders who need to submit and monitor insurance claims, the Insurance Claims Portal is a secure self-service platform that makes claim registration, document submission and settlement tracking simple and transparent. Unlike a fully manual process, it provides guided claim submission, clear status information and timely notifications, helping customers understand what is required and what happens next.

Why Agile is suitable

Agile is suitable because claim workflows, document requirements and customer expectations may change as the insurer receives feedback from users, operations staff and compliance teams. The team can deliver the portal in small increments: first claim registration, then document upload, tracking and notifications. Frequent demonstrations help stakeholders validate the workflow early and identify missing requirements before the entire system is built.

Aspect	Waterfall	Agile
Planning	Most requirements and scope are fixed at the beginning.	Work is planned iteratively and refined as feedback arrives.
Delivery	Usually one major delivery near the end.	Small, usable increments are delivered regularly.
Change	Late changes can be expensive and disruptive.	Changes can be considered in backlog refinement and future sprints.
Feedback	Often received at major review points.	Frequent reviews with users and stakeholders.
Best fit here	Useful when requirements are stable and fully known.	Better fit because workflows and user needs need ongoing validation.

Task 2 – Epics and User Stories

Four epics are defined below. The 14 stories are written in the standard “As a…, I want…, so that…” format.

Story ID	Epic	User story	Points
CR-01	Claim Registration	As a policyholder, I want to sign in securely, so that only I can access my claim information.	3
CR-02	Claim Registration	As a policyholder, I want to choose a policy and claim type, so that my claim is registered under the correct coverage.	3
CR-03	Claim Registration	As a policyholder, I want to enter incident details and submit a claim, so that the insurer can begin reviewing it.	5
CR-04	Claim Registration	As a policyholder, I want to receive a claim reference number, so that I can identify and follow up on my submission.	2
DU-01	Document Upload	As a policyholder, I want to see the documents required for my claim type, so that I know what evidence to prepare.	2
DU-02	Document Upload	As a policyholder, I want to upload a supporting document, so that the insurer receives evidence for my claim.	5
DU-03	Document Upload	As a policyholder, I want to see upload success or failure messages, so that I know whether each document was received.	2

Story ID	Epic	User story	Points
DU-04	Document Upload	As a policyholder, I want to replace an incorrect document before review, so that I can correct my submission.	3
CT-01	Claim Tracking	As a policyholder, I want to view the current status of a claim, so that I understand its progress.	3
CT-02	Claim Tracking	As a policyholder, I want to view the timeline of claim status changes, so that I can see what has happened so far.	5
CT-03	Claim Tracking	As a policyholder, I want to view requests for additional information, so that I can respond without delay.	3
SN-01	Settlement Notifications	As a policyholder, I want to receive an acknowledgement when my claim is submitted, so that I know it was received.	2
SN-02	Settlement Notifications	As a policyholder, I want to be notified when my claim status changes, so that I do not need to check the portal repeatedly.	3
SN-03	Settlement Notifications	As a policyholder, I want to receive the settlement decision and payment details, so that I understand the outcome of my claim.	5

Epic grouping: Claim Registration (CR-01 to CR-04), Document Upload (DU-01 to DU-04), Claim Tracking (CT-01 to CT-03), Settlement Notifications (SN-01 to SN-03).

Task 3 – INVEST Review and Vertical Story Splitting

INVEST means Independent, Negotiable, Valuable, Estimable, Small and Testable. Each story was checked against these qualities. Stories that combine several user outcomes should be split by customer-visible capability, not by technical layer such as “build database”, “write API” or “create UI”.

Story	Review	Action / vertical split
CR-03 – Enter incident details and submit claim	Potentially large: data entry and submission may include several distinct outcomes.	Split into: (1) save claim details as draft; (2) validate and submit a complete claim. Both deliver user-visible value.
DU-02 – Upload supporting document	May be large if it includes multiple file types, size rules and many documents.	Start with one supported file upload and confirmation; add multiple-document upload and additional file formats as separate stories if needed.
CT-02 – View status timeline	Could be too large if it includes filtering, exports and a full audit history.	Deliver a basic chronological timeline first; add filters or downloadable history later as separate stories.
SN-03 – Settlement decision and payment details	May combine decision display, payment details and several delivery channels.	Split into: display settlement decision in portal; display payment reference/details; add optional email/SMS delivery as a later story.

INVEST conclusion: The 14 stories are suitable as an initial backlog, but CR-03 and the larger document, timeline and settlement stories should be refined before sprint commitment. The vertical splits above preserve an end-to-end customer outcome.

Task 4 – Acceptance Criteria for Claim Registration

The following Given / When / Then criteria cover the four Claim Registration stories, including a negative validation-failure scenario.

CR-01 – Secure sign-in

Given the policyholder has a registered account, when they enter valid credentials and submit the sign-in form, then the portal authenticates them and displays their account dashboard.
Given the policyholder enters an incorrect password, when they submit the form, then the portal displays a safe error message and does not reveal which credential was incorrect.

CR-02 – Choose policy and claim type

Given the policyholder is signed in and has one or more policies, when they open claim registration, then the portal displays the policies available to their account.
Given the policyholder selects a policy and a claim type, when they continue, then the portal records both selections for the claim.

Given no eligible policy is available, when the policyholder tries to continue, then the portal explains that no eligible policy is available and prevents claim creation.

CR-03 – Enter incident details and submit a claim

Given the policyholder has selected a policy and claim type, when they enter all required incident details and submit the form, then the portal validates the information and creates the claim.
Negative scenario: Given one or more required fields are missing or invalid, when the policyholder submits the form, then the portal highlights the affected fields, explains what must be corrected and does not create the claim.
Given the incident date is in the future, when the policyholder submits the form, then the portal rejects the date and displays a clear validation message.

CR-04 – Receive a claim reference number

Given a claim has been successfully submitted, when the portal completes claim creation, then it generates a unique claim reference number and displays it on the confirmation page.
Given the policyholder views the confirmation page, when they return to their claim list, then the same reference number is visible beside the newly created claim.

Task 5 – Planning Poker Estimation and Backlog Size

Fibonacci story points (1, 2, 3, 5, 8, 13) represent relative effort, complexity and uncertainty. Estimates below are proposed Planning Poker outcomes for the initial backlog. The team should confirm them through discussion during a real estimation session.

ID	Story summary	Points	Reason
CR-01	As a policyholder, I want to sign in securely, so that only I can access my claim information.	3	Straightforward authentication flow.
CR-02	As a policyholder, I want to choose a policy and claim type, so that my claim is registered under the correct coverage.	3	Policy and claim-type selection with eligibility checks.
CR-03	As a policyholder, I want to enter incident details and submit a claim, so that the insurer can begin reviewing it.	5	Several fields, business validations and claim creation.
CR-04	As a policyholder, I want to receive a claim reference number, so that I can identify and follow up on my submission.	2	Generate and display a unique reference.
DU-01	As a policyholder, I want to see the documents required for my claim type, so that I know what evidence to prepare.	2	Display a rules-based checklist.
DU-02	As a policyholder, I want to upload a supporting document, so that the insurer receives evidence for my claim.	5	File handling, security and upload validation.
DU-03	As a policyholder, I want to see upload success or failure messages, so that I know whether each document was received.	2	Success and failure feedback.
DU-04	As a policyholder, I want to replace an incorrect document before review, so that I can correct my submission.	3	Replace an existing document safely.
CT-01	As a policyholder, I want to view the current status of a claim, so that I understand its progress.	3	Retrieve and display current claim status.
CT-02	As a policyholder, I want to view the timeline of claim status changes, so that I can see what has happened so far.	5	Chronological history requires more data and presentation logic.
CT-03	As a policyholder, I want to view requests for additional information, so that I can respond without delay.	3	Display insurer requests and response instructions.
SN-01	As a policyholder, I want to receive an acknowledgement when my claim is submitted, so that I know it was received.	2	Simple acknowledgement trigger.
SN-02	As a policyholder, I want to be notified when my claim status changes, so that I do not need to check the portal repeatedly.	3	Status-change event and notification delivery.
SN-03	As a policyholder, I want to receive the settlement decision and payment details, so that I understand the outcome of my claim.	5	Decision and payment information with important business rules.

Total initial backlog estimate: 46 story points across 14 stories.

Outlier discussion: CR-03 was initially considered for 8 points because it combines incident data entry, validation and claim submission. The team discussed the scope and reduced the estimate to 5 after separating draft saving and other advanced behaviour into follow-up stories. If the team still sees the story as larger than one sprint-sized item, it should be split before commitment rather than keeping an oversized 8- or 13-point story.

Planning Poker procedure: each team member selects a Fibonacci value privately; all values are revealed together; the highest and lowest estimates explain their reasoning; the team discusses assumptions and votes again until a shared estimate is reached.

Task 6 – Jira Project, Board, Workflow and Definition of Done

Suggested Jira configuration

Configuration	Value
Project name	Insurance Claims Portal
Project type	Jira Software – Scrum project
Board	Insurance Claims Scrum Board
Epics	Claim Registration; Document Upload; Claim Tracking; Settlement Notifications
Issue types	Epic and Story (plus Task/Bug if required)
Workflow	To Do → In Progress → In Review → Done
Estimation	Story Points using the Fibonacci values

Board workflow meaning

To Do: Story is accepted into the sprint but work has not started.
In Progress: A team member is actively implementing the story.
In Review: Work is awaiting peer review, testing or Product Owner validation.
Done: All Definition of Done conditions are satisfied and the increment is potentially releasable.

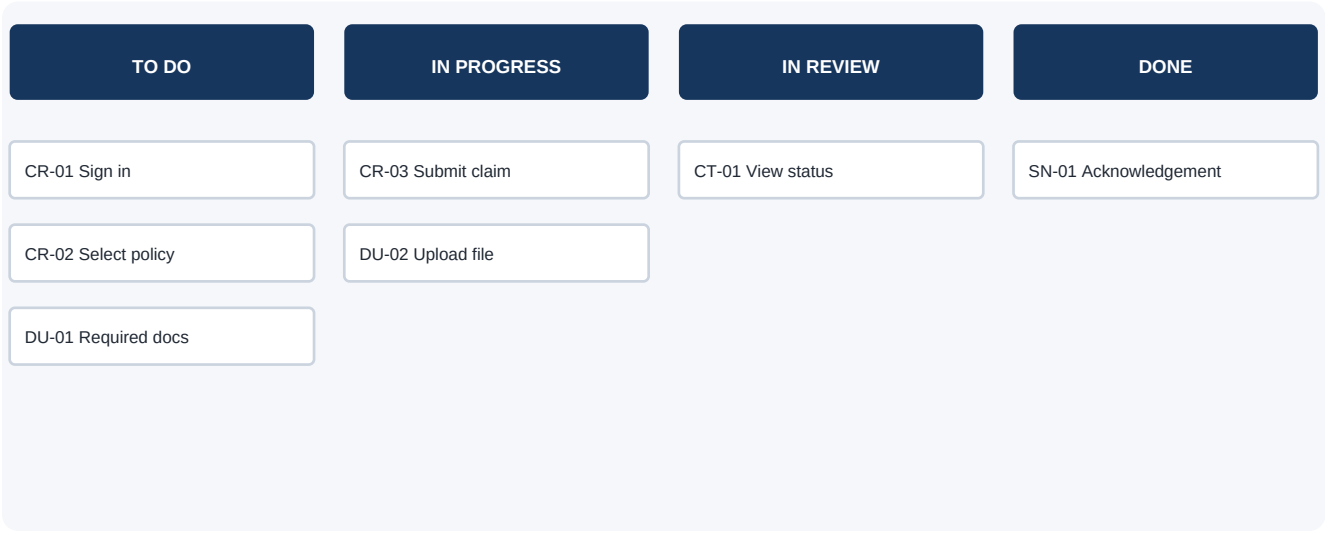

Definition of Done (DoD)

A story is Done only when all applicable checks below are met:

No.	Definition of Done checklist
1	Acceptance criteria are satisfied and demonstrated.
2	Code is complete and follows agreed coding standards.
3	Unit tests pass; relevant integration tests pass.
4	Security and privacy checks are completed for policyholder and claim data.
5	No known critical or high-severity defects remain open.
6	Peer review is completed and approved.
7	User-facing messages and relevant documentation are updated.
8	The feature is integrated into the agreed build and Product Owner accepts it.

Illustrative Jira board layout

The diagram below is a clean illustrative board layout for the proposed workflow. It is not a live Jira screenshot or evidence of an actual Jira project.

Jira implementation note

Create the four epics, add the 14 stories under the correct epic, enter the story-point estimates and configure the workflow statuses. Attach the DoD page or link it from the project documentation. The board graphic above is provided as a layout reference; capture a real screenshot from Jira after completing the configuration if the instructor requires actual Jira evidence.

One-Page Note – Scrum Roles, Events and Artifacts

Scrum roles

Role	Responsibility in this project
Product Owner	Owns and orders the product backlog, clarifies claim-processing requirements and maximises customer and business value.
Scrum Master	Helps the team use Scrum effectively, facilitates events and works to remove impediments.
Developers	Cross-functional team members who design, build, test and integrate the portal increment.

Scrum events

Event	Purpose
Sprint	A fixed-length iteration (for example, one week) in which the team creates a usable increment.
Sprint Planning	The team agrees why the sprint is valuable, what can be completed and how the work will be done.
Daily Scrum	Developers inspect progress toward the Sprint Goal and adapt their plan.
Sprint Review	The team demonstrates the increment and gathers stakeholder feedback.
Sprint Retrospective	The team identifies improvements to its process and teamwork.

Scrum artifacts and commitments

Artifact	Meaning / commitment
Product Backlog	Ordered list of product work; commitment: Product Goal.
Sprint Backlog	Sprint Goal, selected backlog items and delivery plan; commitment: Sprint Goal.
Increment	Usable, integrated product work that meets the DoD; commitment: Definition of Done.

Application to the Insurance Claims Portal

The Product Owner orders the four epics according to customer value and risk. During Sprint Planning, the Developers select a realistic set of stories and define a Sprint Goal, such as enabling a policyholder to register a claim. The Daily Scrum helps the team coordinate work and identify blockers. At the Sprint Review, stakeholders inspect the working claim flow and provide feedback. The Retrospective helps the team improve its process for the next sprint. The Product Backlog, Sprint Backlog and Increment provide transparency, while the Definition of Done ensures completed work meets an agreed quality standard.

Conclusion

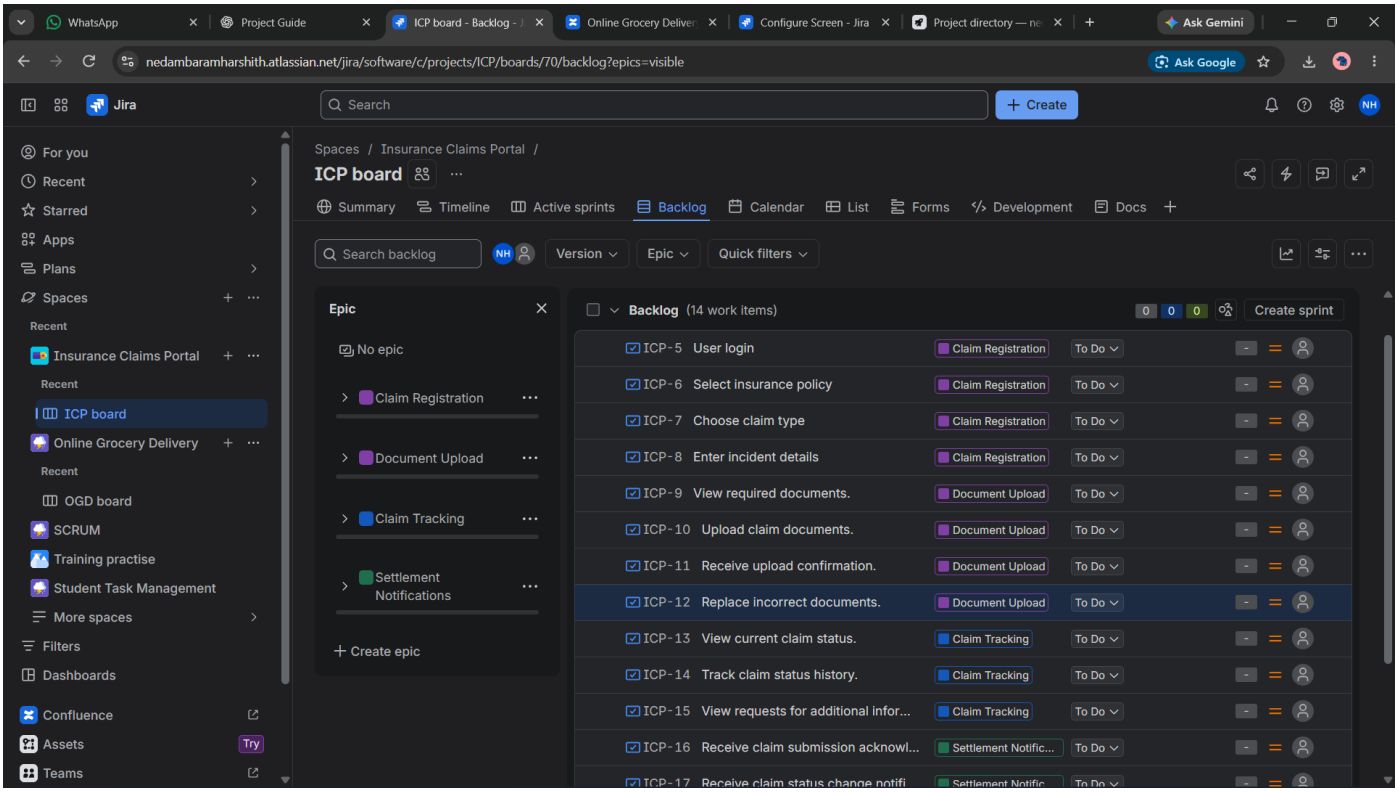

This assignment defines a product vision, four epics, 14 user stories, INVEST-based refinement, Given / When / Then acceptance criteria, Fibonacci estimates and a Jira workflow for an Insurance Claims Portal. The initial backlog estimate is 46 story points. The proposed Scrum approach supports incremental delivery and regular validation of the claims experience.

JIRA IMPLEMENTATION EVIDENCE

Day 3 – Set 2 | Insurance Claims Portal | N. Harshith

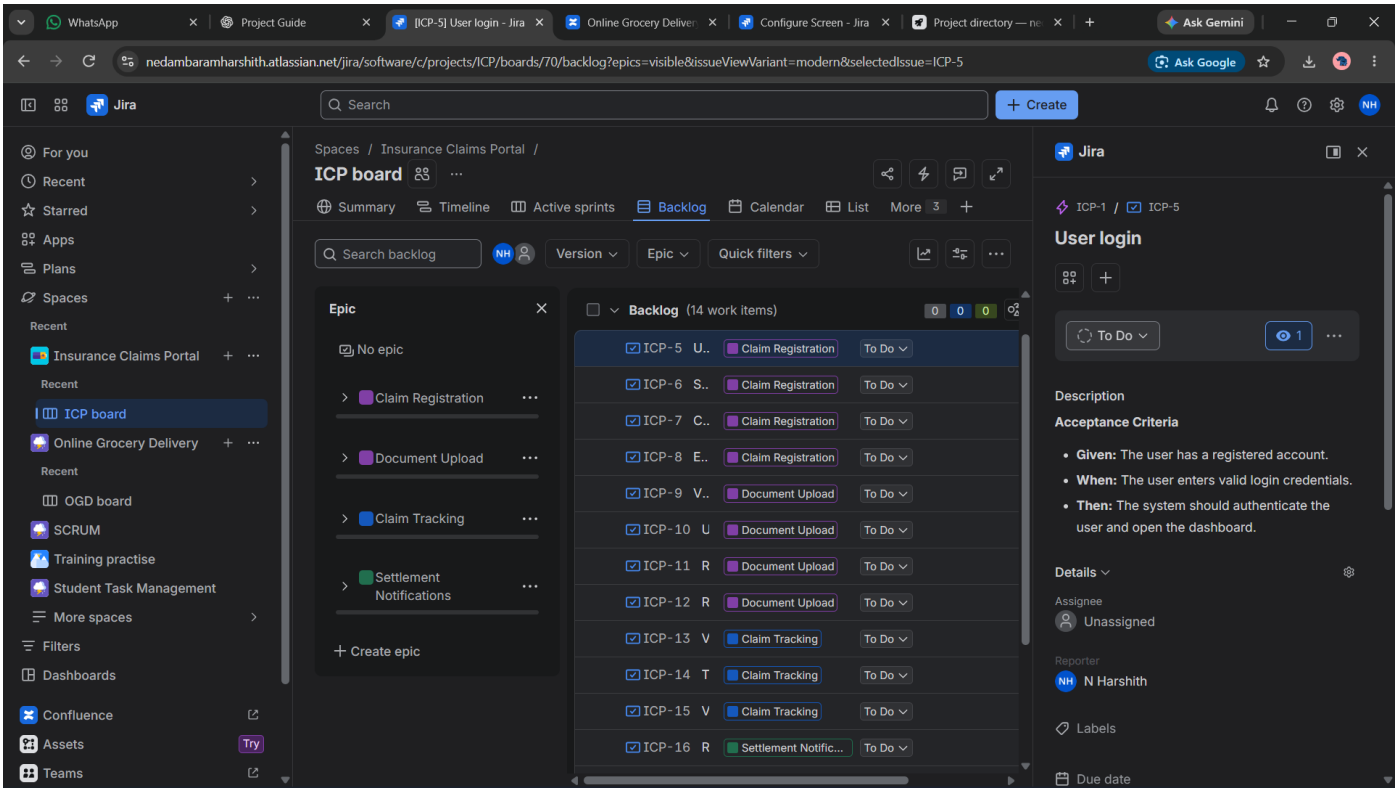

Jira backlog – 4 Epics and 14 User Stories

Shows all four Epics, 14 User Stories, their Epic assignments and To Do status.

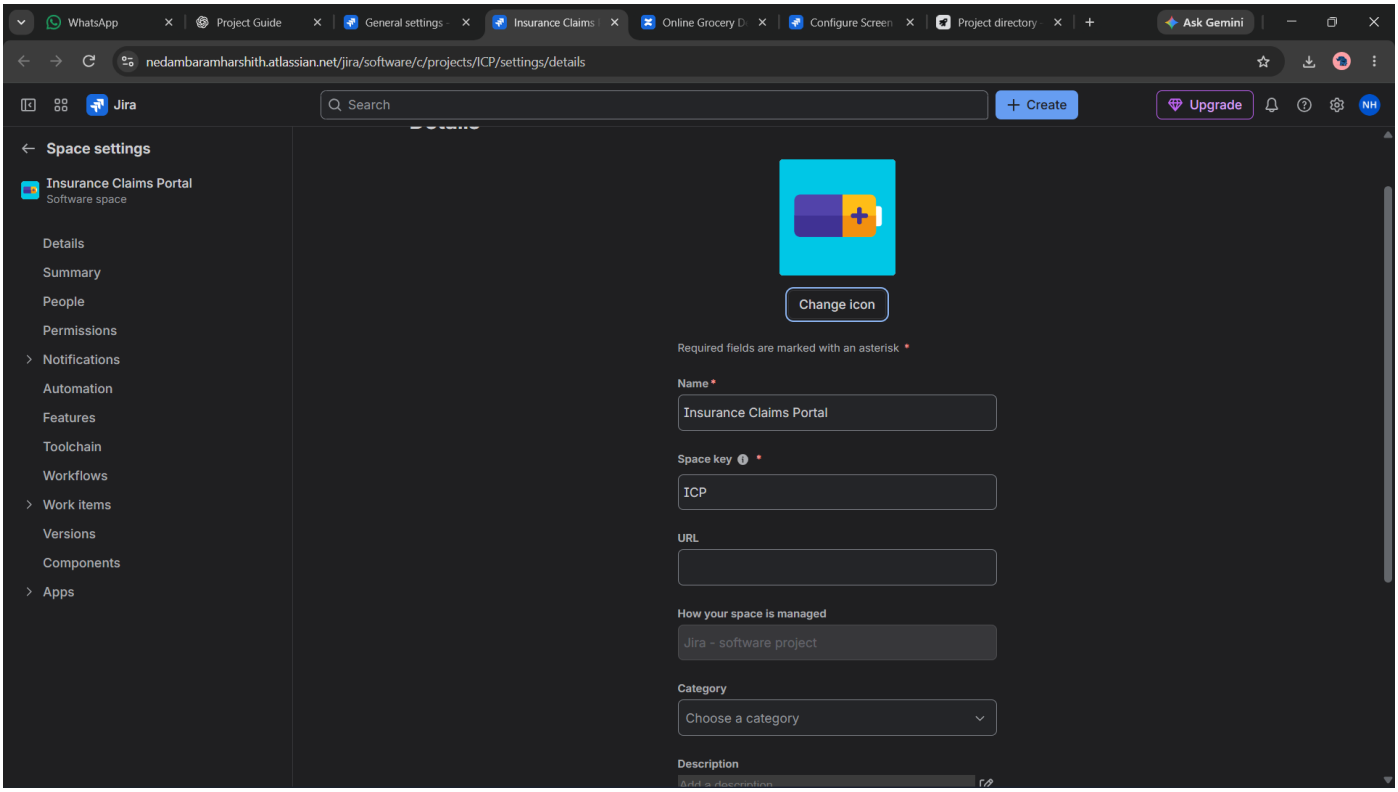

Acceptance criteria – ICP-5 User login

Shows the Given / When / Then acceptance criteria saved in the User login story.

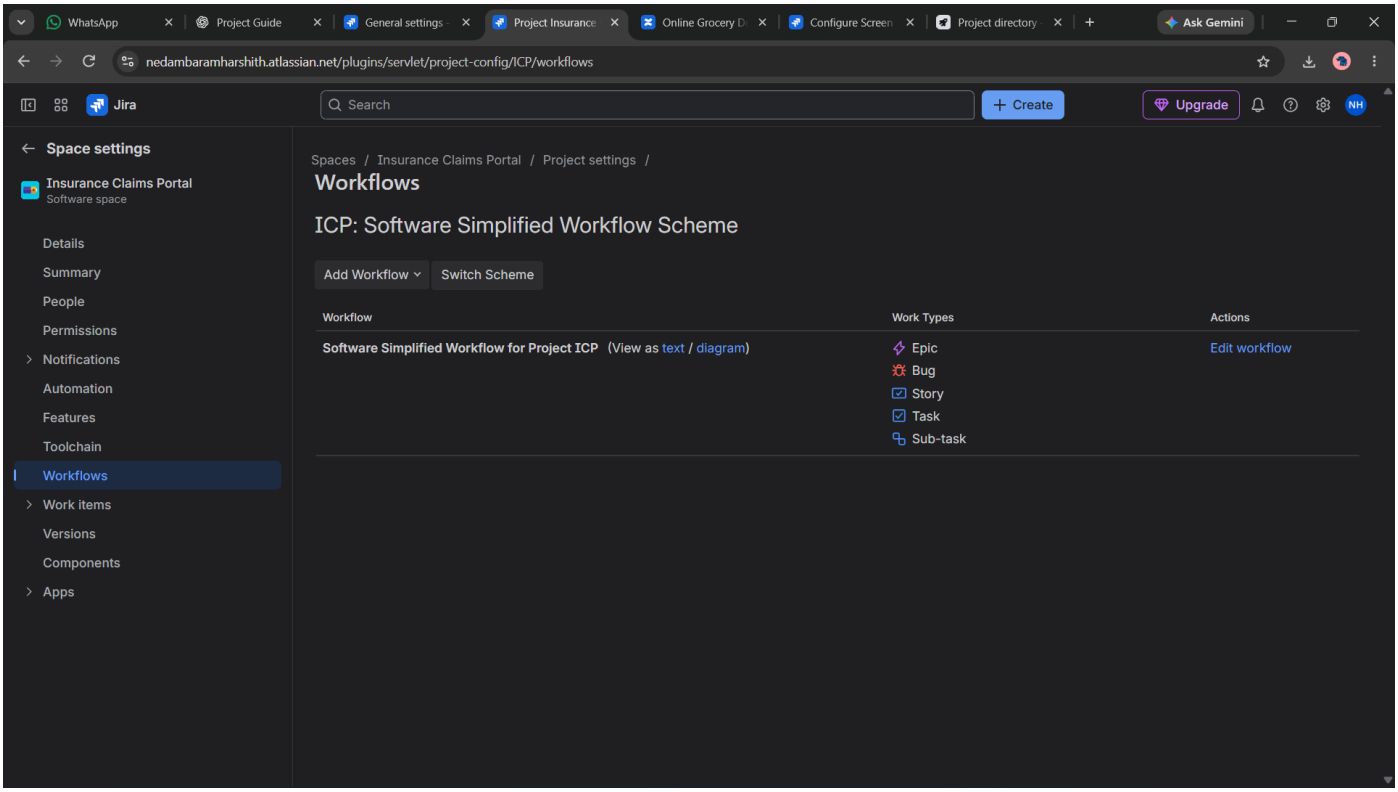

Insurance Claims Portal – Space settings

Shows the project settings and configuration navigation.

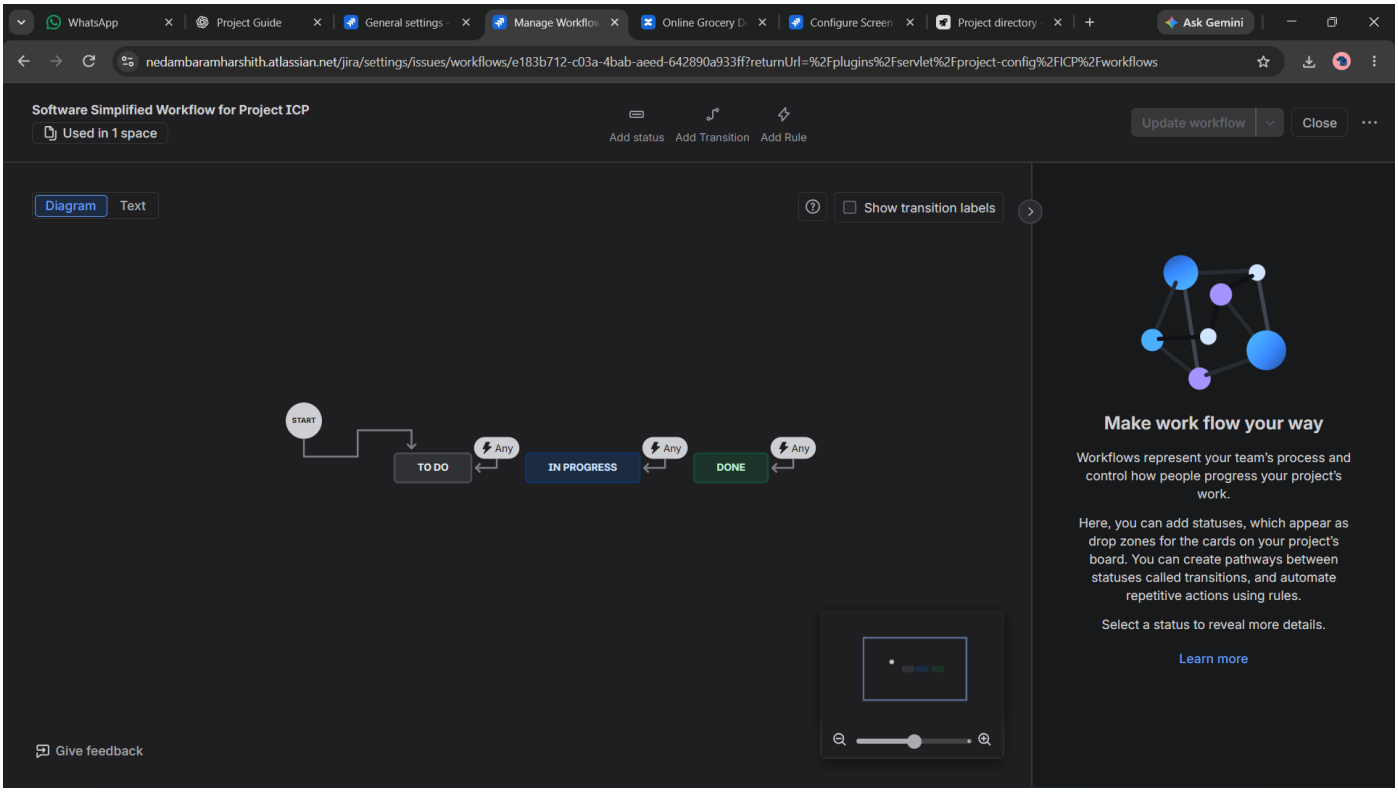

Workflow configuration page

Shows the project workflow scheme.

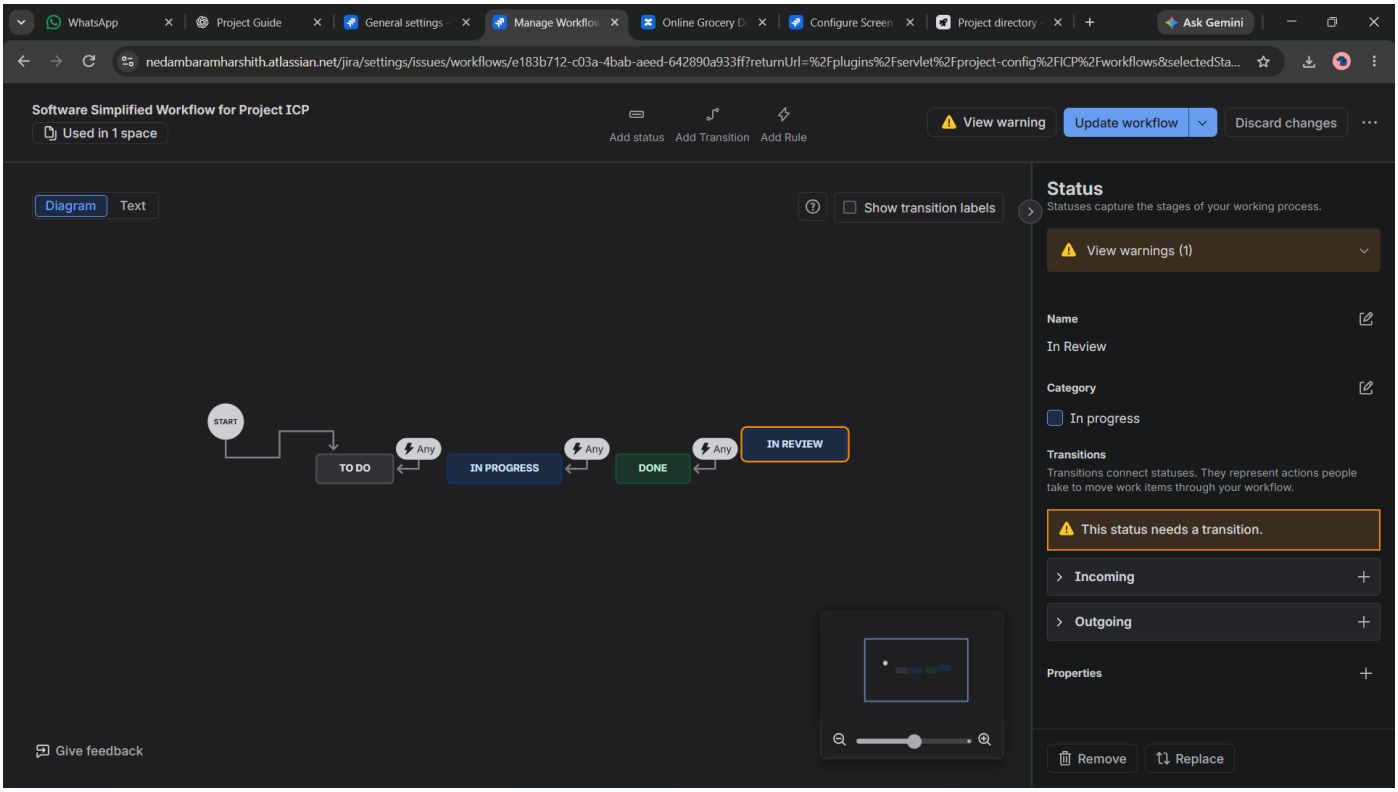

Workflow editor – existing statuses

Shows the initial To Do, In Progress and Done statuses.

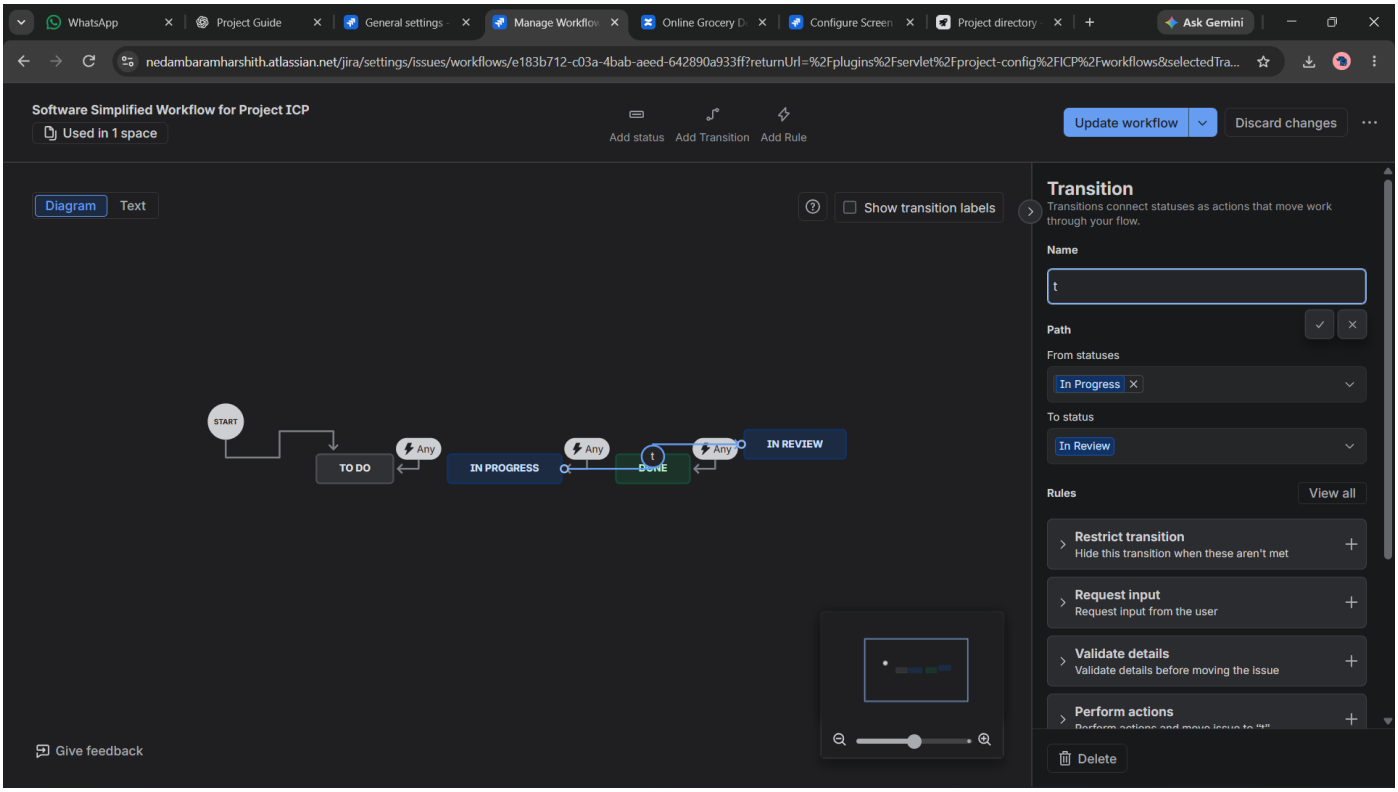

Workflow editor – In Review

Shows the In Review status and the transition being configured.

Workflow editor – In Review to Done

Shows the Approve and Complete transition from In Review to Done.

Workflow editor – latest configuration

Latest screenshot of the workflow editor; publish confirmation is not visible.
